# LUXURY FASHION MARKET INTELLIGENCE

Competitive pricing, product assortment & discount analysis | Farfetch France | 17 November 2023

## BUSINESS QUESTION

How can a luxury fashion intelligence team use a historical marketplace listing snapshot to benchmark product assortment, selling prices and promotional activity across categories and brands?

## DATASET AND SCOPE

The analysis uses 461,481 Farfetch France product listings from a snapshot dated 17 November 2023. It covers clothing (291,236), shoes (81,975), accessories (53,809) and bags (34,461). Prices are in euros. These are product listings, not orders, sales or revenue.

## WORKFLOW

Python was used to clean the source data and explore product categories, brands, prices and discounts. The cleaned dataset was loaded into PostgreSQL for SQL-based aggregation and comparisons. A browser-based Data Studio (formerly Looker Studio) report was built with three KPI cards, five category/brand charts and interactive category and brand filters.

## KEY FINDINGS

**Assortment:** Clothing represents approximately 63.1% of listings, the largest category.
**Pricing:** Bags have the highest average listed selling price (€939.46), followed by clothing (€670.01), shoes (€507.39) and accessories (€314.46). The overall average is €619.79.
**Discount prevalence:** Approximately 28.27% of listings are discounted. Clothing has the highest category discount rate (33.2%), followed by shoes (27.82%), bags (13.74%) and accessories (11.53%).
**Discount depth:** Among discounted products only, average discount percentages are about 35.93% for clothing, 34.62% for shoes, 32.44% for accessories and 30.99% for bags.

## BUSINESS INTERPRETATION AND POTENTIAL APPLICATIONS

The larger clothing assortment suggests that category deserves substantial attention in assortment benchmarking. Bags have the highest average listed price, so category-specific price comparisons are important. Differences in discount prevalence suggest that promotional monitoring should be segmented by category rather than relying on a single overall rate. These are analytical implications, not evidence of retailer strategy or customer demand.

## LIMITATIONS

This is a single historical snapshot, not a time series. Listings do not reveal units sold, demand, profit margins or sales revenue. Product mix and price differences may affect brand comparisons. Findings should not be presented as current market conditions. Source dataset redistribution rights have not yet been verified.

## PORTFOLIO DELIVERABLES

Interactive Data Studio dashboard; exported dashboard PDF; Python cleaning and exploratory analysis; PostgreSQL SQL queries; and this concise case study. Before publication, check notebooks and SQL scripts for credentials, local paths and redistribution restrictions.

Historical listing data • Not a live market report • Not sales or revenue data
